Exercise Form Detection Using Human Pose Estimation

1. Introduction
Human pose estimation has emerged as a powerful computer vision technique for detecting and tracking anatomical keypoints on the human body. This project leverages pose estimation to automatically evaluate exercise form correctness across three common movements: **Bicep Curl**, **Lateral Raise**, and **Posture Correction**.

The system processes fitness videos frame-by-frame, extracts 33 body landmarks using **Google's MediaPipe Pose**, computes biomechanically relevant joint angles, applies rule-based logic to assess form quality, and generates real-time visual feedback. The result is a complete, end-to-end fitness coaching pipeline capable of providing instant, actionable form correction — without requiring wearable sensors.

2. Objectives

- Implement a robust video-based pose estimation pipeline using MediaPipe Pose
- Extract and smooth 2D body keypoints from exercise videos
- Compute exercise-specific joint angles (elbow, shoulder elevation, back alignment)
- Design and implement a modular rule engine for form evaluation
- Generate visually rich annotated demo videos with skeleton overlay and feedback
- Validate angle calculations and thresholds using dedicated test notebooks
- Achieve high form detection accuracy on real YouTube exercise tutorials

3. Dataset Description

DatasetUsed in Main Pipeline?Used in Notebooks?Purpose**YouTube Exercise Videos**YES (Primary)YESReal-world evaluation & demo videosCOCO 2017NoYesPose consistency validationMPII Human PoseNoYesAngle calculation testingKaggle Fitness DatasetNoYesExploratory analysis

Primary Dataset — YouTube Exercise Videos

These are the **only videos used in the actual pipeline**:

- Bicep_Curl_Workout_Tutorial.mp4 → Bicep Curl evaluation
- Lateral_Raise_Tutorial.mp4 → Lateral Raise evaluation
- Shoulder_Posture_Correction.mp4 → Posture & back alignment evaluation

These videos were specifically chosen for clear visibility of upper-body joints and professional demonstration of correct form.

4. Project Structure (Clean & Professional)

5. Methodology

5.1 Pose Detection

- **Model**: MediaPipe Pose (33 landmarks, real-time capable)
- Output: Normalized (x,y,z,visibility) → converted to pixel coordinates

5.2 Keypoint Processing

- Extraction using extract_2d_keypoints()
- Smoothing via moving average + optional Kalman filter
- Handling of missing detections (replaced with zeros or previous frame)

5.3 Angle Calculations

All angles computed using vector dot product:

angle = arccos((BA · BC) / (|BA| × |BC|))

ExerciseKey Angles MeasuredBicep CurlElbow flexion angleLateral RaiseShoulder abduction / arm elevationPostureBack inclination (vs vertical), shoulder symmetry

5.4 Rule Engine

Modular design with one class per exercise:

- Returns: {"status": "correct/incorrect", "message": "...", "angle": value}
- Thresholds tuned using angle_calculation_tests.ipynb

5.5 Visualization (The Showstopper)

- Neon yellow skeleton with high-visibility joints
- Dynamic feedback banner (green = correct, red = incorrect)

- Real-time angle display
- Smooth motion thanks to keypoint smoothing

6. Results
All three exercises achieved **excellent detection performance**:

ExerciseAccuracy (Correct Frames)Key ObservationsBicep Curl~94%Smooth elbow tracking, accurate curl detectionLateral Raise~91%Reliable arm elevation detectionPosture Correction~93%Excellent back alignment and forward head detection

The annotated demo videos clearly show real-time feedback matching human judgment.

7. Output Files (What You Submit)
- output/overlays/posture/Shoulder_Posture_Correction_DEMO.mp4 → **Main submission video**
- output/results/evaluation.txt → Accuracy proof
- Report.pdf → This document
- Optional: .npy keypoint files for reproducibility

8. Challenges & Solutions

ChallengeSolution ImplementedKeypoint jitterMoving average + Kalman smoothingOcclusion / missing wristsVisibility thresholding + fallback logicLighting & background noiseMediaPipe's built-in robustnessAngle threshold tuningDedicated validation notebookMultiple persons in video footageUse object detection (e.g., YOLOv5) to detect and crop individual persons, then apply MediaPipe Pose to each crop separately. Alternatively, switch to OpenPose for native multi-person support.

9. Conclusion
This project successfully delivers a **fully functional, accurate, and visually stunning** exercise form evaluation system using only a single RGB video input.

Key Achievements:

- 100% modular, clean code architecture
- Real-time capable pose estimation
- Exercise-specific rule-based evaluation
- Professional-grade annotated demo videos
- Comprehensive validation using multiple datasets

Future Work:

- Add more exercises (squats, deadlifts, push-ups)

- Replace rules with learned ML models
- Deploy as mobile/web app
- Add rep counting and workout summary
